CARDAN JOINT THEORY

The PTO drive shaft for agricultural applications consists of two cardan joints and a telescopic coupling. The cardan joint, consisting of two yokes and a cross, is the element used to transmit the motion between two tilted axles. The cardan joint construction is designed so that during rotation, the speed of the output shaft is not always equal to that of the input shaft and this difference in speed depends on the articulation angle of the joint (Fig.1). The transmission ratio versus the articulation angle and the rotation angle is represented in Fig. 2. The more the ratio deviates from 1 the greater becomes the irregularity of the motion, thus generating undesirable effects(vibrations,noise,inertial stress).

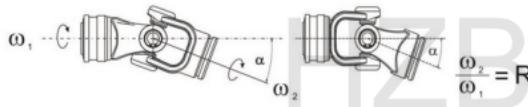

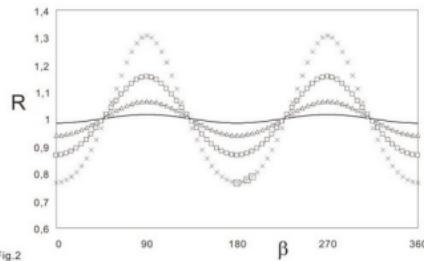

Fig.1

Instantaneous transmission ratio
 α =articulation angle β =rotation angle

CARDAN JOINT THEORY

The standard PTO drive shaft consists of two cardan joints. The irregularities of the single joints thus can be cancelled or mutually combined. When the articulation angles of the two joints are equal (see configuration W or Z in Fig.3) the transmission is uniform,i.e.The speed of the output yoke is always equal to the speed of the input yoke,thus eliminating the undesirable effects. In all the other angulations(Fig.4),an irregularity always remains that can be evaluated with the graph on the following page (Fig.5).

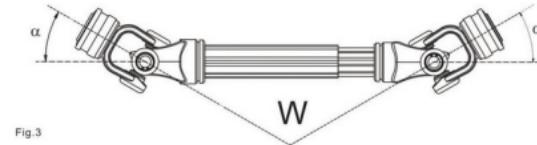

Fig.3

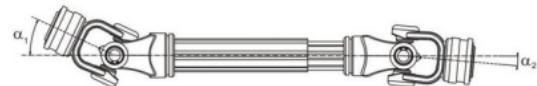

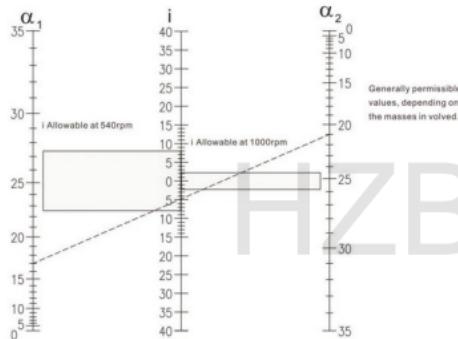

Fig.4

CARDAN JOINT THEORY

Irregularity "i" of the motion depends on the articulation of the two cardan joints and on the difference between the articulations of the two joints (see the example:with angular difference being equal,the irregularity is greater if the articulations of the single joints are greater).

PTO drive shaft rotation irregularity alignment chart

Example:
 $\alpha^1 = 0^\circ, \alpha^2 = 4^\circ, \alpha^1-\alpha^2 = 4^\circ$
 $i = 0.5\%$
 $\alpha^1 = 21^\circ, \alpha^2 = 25^\circ, \alpha^1-\alpha^2 = 4^\circ, i = 6\%$

Fig.5

The CVJ (Constant Velocity Joint) is a double universal joint with a centering system that equally divides the articulation angle between the two yokes (W configuration).The speed of the output yoke is always equal to the input speed and there are no rotation irregularities.In a PTO drive shaft with a CVJ joint and a standard joint (Fig.6),the total irregularity is caused only by the standard joint,that therefore must work with small articulation angles.For high work angles at the two ends of the shaft,two CVJ joints must be used (Fig.7).The CVJ joint can work with high articulation angles only for brief periods (ex.:while steering).Absolute quality And reliability of the CVJ construction are ensured by the ball bridge welded to the yoke which considerably reduces stress and consequently wears in the ball-cylinder contact zone and in the splined coupling between the shaft and the yoke.

SAFETY CHAINS**Golden Safety Chains****Silvery Safety Chains**

CODE EXPLANATION

For example

T - 4 - YB - II - P - 4.0505B - 4FFV1 * L

- 1: The Types of Tubes(e.g.:T;L;ST;G)
- 2: The Series of Cross Kits
- 3: The Code of Color (YB=Yellow+Black)
- 4: The Code of Safety Shield Structure
- 5: Connection Method: Pin Connected
- 6: The Tractor End Yokes
- 7: The Implement End Yokes
- 8: Minimum Overall Length

CODE FOR U-JOINT

For example

4.0501B + 4.01 + 4.06

4.0501B+4.01+4.06

- 1: One end yoke
- 2: The series of cross kits
- 3: The other end yoke
